

Spider Preparation List

The areas treated are corners and edges of ceilings and wherever the webs are so that after a day roaming and hunting, the spiders will return and die on contact.

For best results over all we recommend you to water blast the whole external of the house prior to commencing the work. From there we can apply the spray treatment then we recommend doing a cobweb cleanup for any that are left 4-7 days after with a dry broom.

If you are not water blasting, PLEASE LEAVE THE WEBS INTACT BEFORE TREATMENT

The webs can be removed 4 -7 days after treatment using a dry broom. A ceiling cavity treatment is done to kill Daddy long legs and other resident spiders, while White Tail spiders require a more comprehensive treatment due to the nomadic nature of the spider. This will involve treating entire walls, ceilings and floors both inside and outside. Ceiling Cavities subfloors, bottoms of wardrobes and under beds will also require attention.

VACATE PROPERTY FOR 3 TO 4 HOURS (FOR SPRAY) AND ALL PERSONS HAVING ACCESS ARE AWARE OF TREATMENT

Customer returning

- *Upon returning immediately ventilate property
- *Clean all food preparation areas thoroughly
- *Refrain from using cleaning products on treated surfaces
